

New wireless keyboard from Logitech

Logitech has expanded its keyboard line-up with the new Wireless All-in-One Keyboard TK820. It combines everything needed to control and navigate a computer in one sleek keyboard with a built-in touchpad that lets one type and swipe comfortably together.

"This keyboard offers an innovative way to navigate, letting one type, touch and swipe with a single device," said Yousef Atwan, regional director for Middle East and Africa.

The ultra-slim design takes up less space on a desk because it connects wirelessly to the computer and streamlines navigation with a built-in touchpad. The touch area is significantly larger than a built-in laptop touchpad, so one can point, zoom and swipe smoothly and comfortably. It supports up to 13 Windows 8 multi-touch gestures with the download of Logitech SetPoint software.

The keyboard comes with a tiny Logitech Unifying receiver, which uses advanced 2.4 GHz connectivity to give one the reliability of a cord with the convenience of wireless. The wireless connection is robust and reliable, so one can place the keyboard in the most convenient position and still enjoy fast data transmission with virtually no delays or dropouts.
